Table of Contents

1. [Introduction](#)
2. [Getting Started](#)

1.) Introduction

The Block Replicator module allows you to replicate large blocks of text, instead of just small fields which xFlow is designed for. These large blocks of text can be as large as needed. Member's can also edit their fields from the Member's Only Area. Very easy to setup and install.

2.) Getting Started

This page will step you through getting the Block Replicator module setup and running on your server. After the module has been successfully installed on your server, please complete the following steps.

- 1.) First, login to your Admin Control Panel. There will now be a new link under the Installed Modules box, called *Block Replicator*. Click on the link to access the menu for the Block Replicator module. Next, go to *Setup->First Time Setup* and complete the following form. All questions should be fairly straight forward.
- 2.) Once First Time Setup is complete, you can go ahead and add the new merge fields into your self replicating web site. They will now automatically be replaced with the user's information.
- 3.) The last thing you need to do is create a link in your Member's Only Area to allow your member's the ability to edit the new database fields. Some where in your Member's Only Area web site, add the following link:

`index.cgi?~authtext~&module=block&action=edit_fields`

Once the link has been added, your members will be able to edit the new database fields simply by clicking on that link from inside the Member's Only Area.
